

## Slide 2 — Introduction

- **What system compromising means:** It means an attacker breaks into a system without permission and gains control of files, accounts, or devices.
- **How attacks follow after reconnaissance:** After attackers gather information about the target, they use it to find a weakness and launch their attack to enter the system.
- **Why attackers compromise systems:** They do it to steal data, earn money, cause damage, or gain control over more systems.

## Slide 3 — Current Trends in Cyber Attacks

- **Extortion (ransomware):** Attackers lock your files and ask for payment to unlock them.
- **Data manipulation:** Changing or altering data to mislead, cheat, or harm an organization.
- **IoT device attacks:** Targeting smart devices because they often have weak security.
- **Backdoors:** Secret ways attackers create to sneak back into a system anytime.
- **Cloud hacking:** Attacking cloud services to steal data or take over accounts.
- **Phishing:** Fake emails or messages that trick people into giving passwords or sensitive info.
- **Zero-day exploits:** Using unknown software flaws that are not yet fixed.

## Slide 4 — Extortion Attacks (Ransomware)

- **WannaCry & Petya examples:** Famous ransomware attacks that spread quickly and encrypted data worldwide.
- **How attackers demand payment:** They show a message demanding money, usually in cryptocurrency, to restore files.
- **Impact on organizations and users:** Causes data loss, downtime, financial loss, and stops important services from operating.
